

# How to Update a Mapbox Tileset

1 Navigate to <https://studio.mapbox.com/tilesets/>

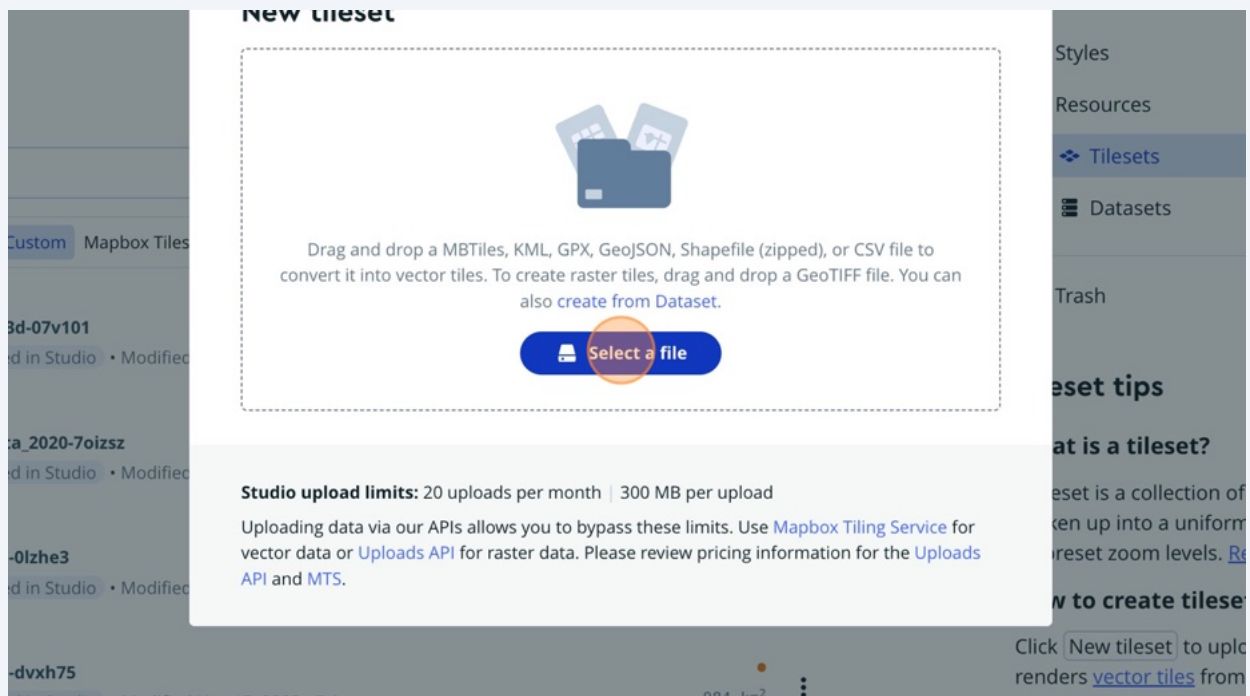

2 Click "Tilesets"

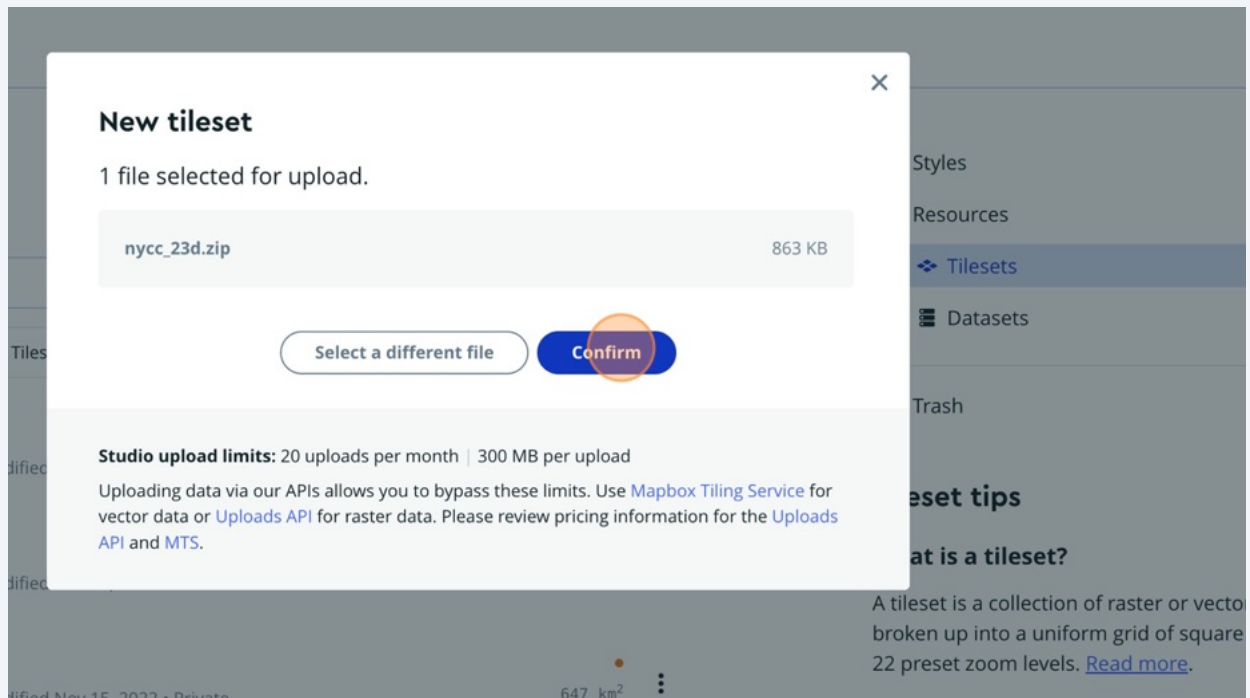

### 3 Click "New tileset"

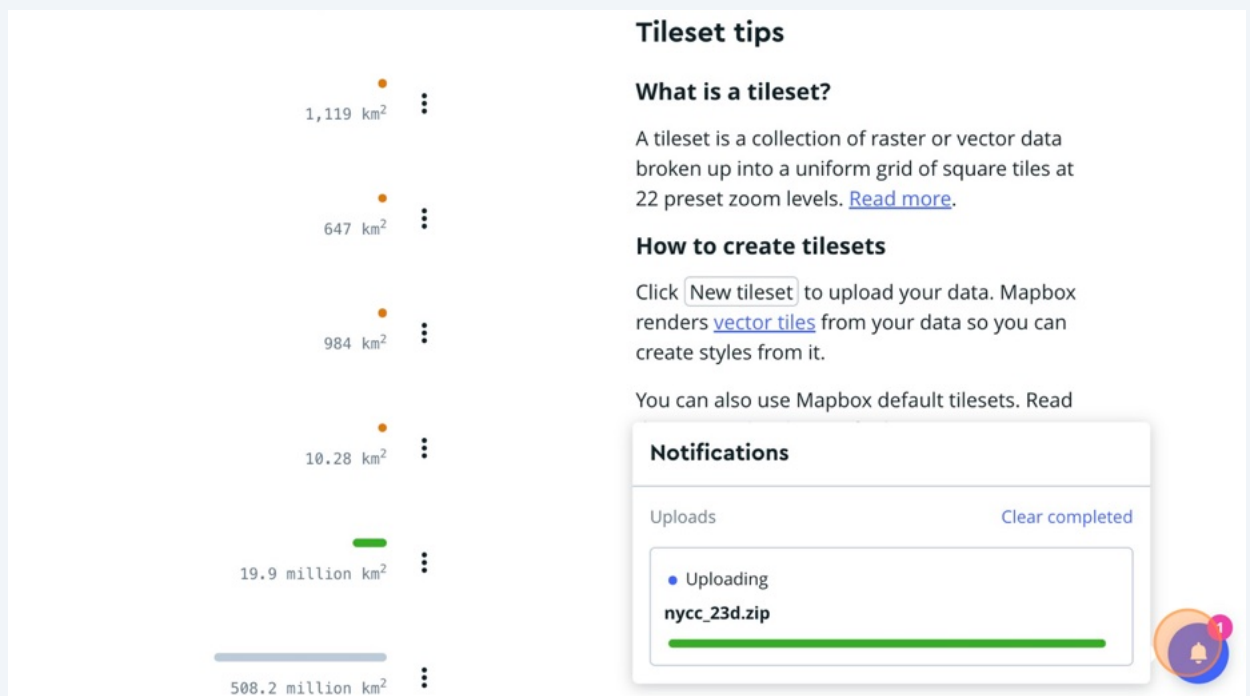

### 4 Select a file and upload the ZIPPED shapefile (ie. for Council Districts, we uploaded the full nycc\_23d.zip - NOT the GeoJSON)

## 5 Click "Confirm"

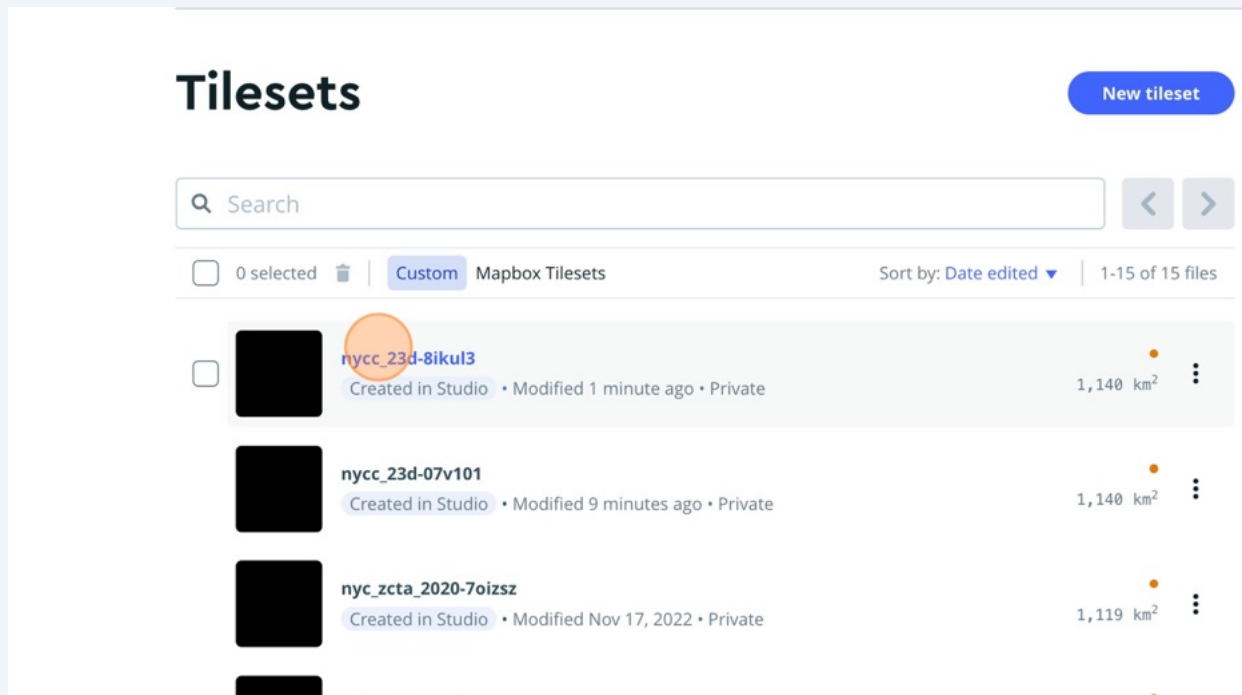

## 6 You can click the notification bell in the bottom right to view the status of the tileset upload

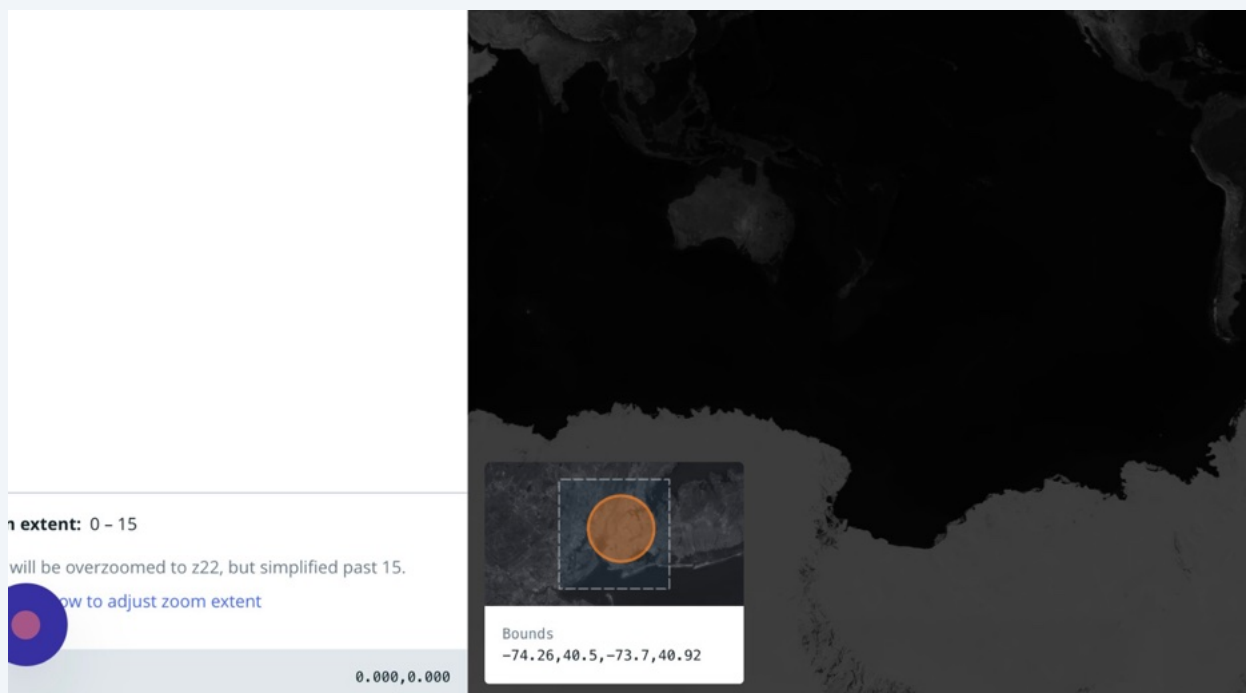

7

Once complete, open the TILESET (ie. click "nycc\_23d-8ikul3"). You cannot rename the tileset, but you won't need to.

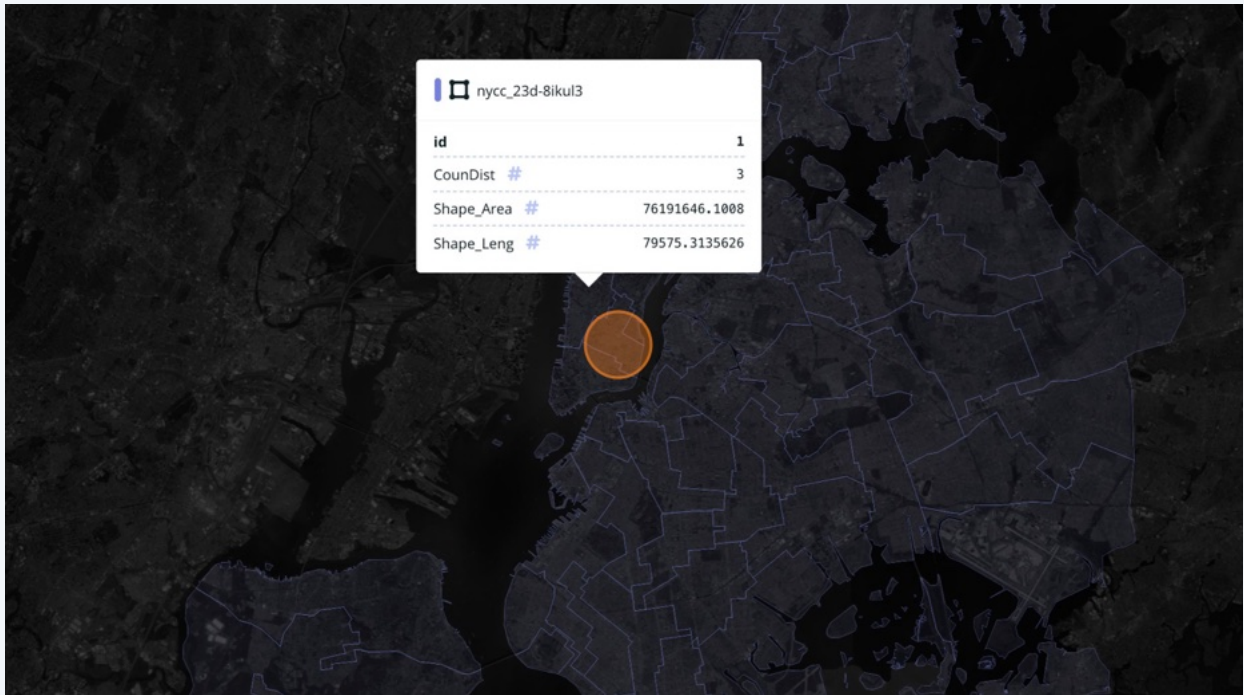

8

To view / verify the tileset, you can click on the bounding box to zoom.

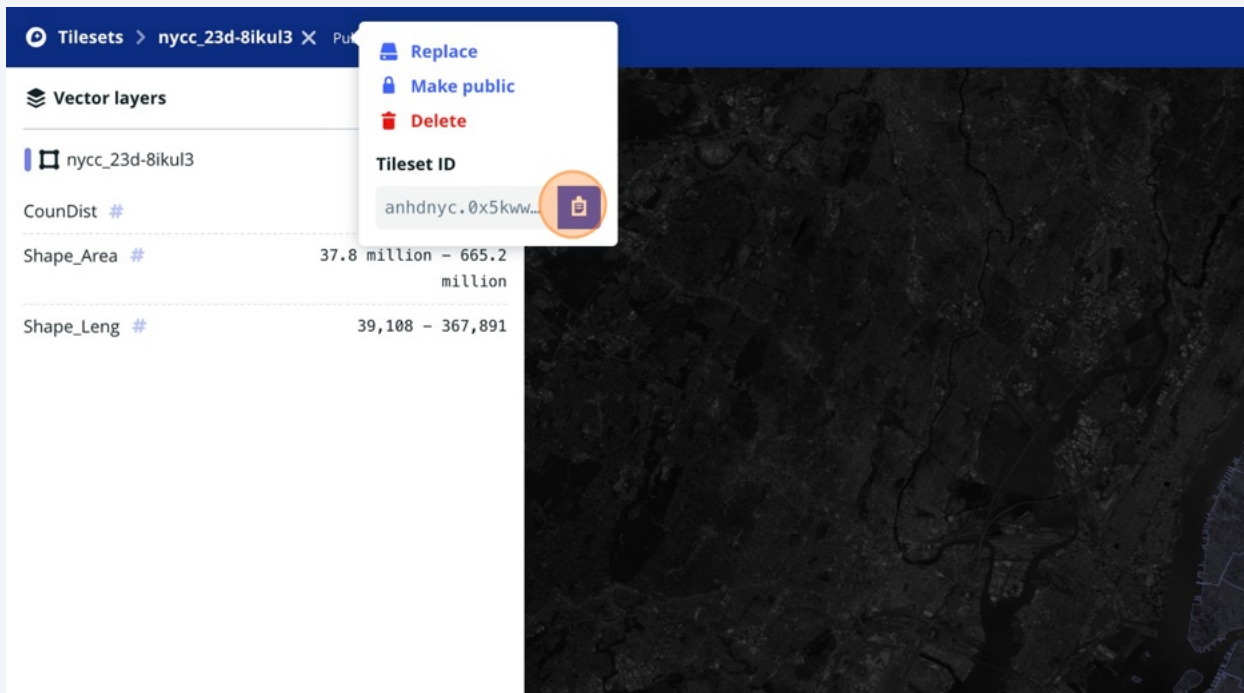

9

You can then navigate the map and click the different shapes to confirm it's the correct dataset. (ie. This dataset has the different CounDist's for each shape).

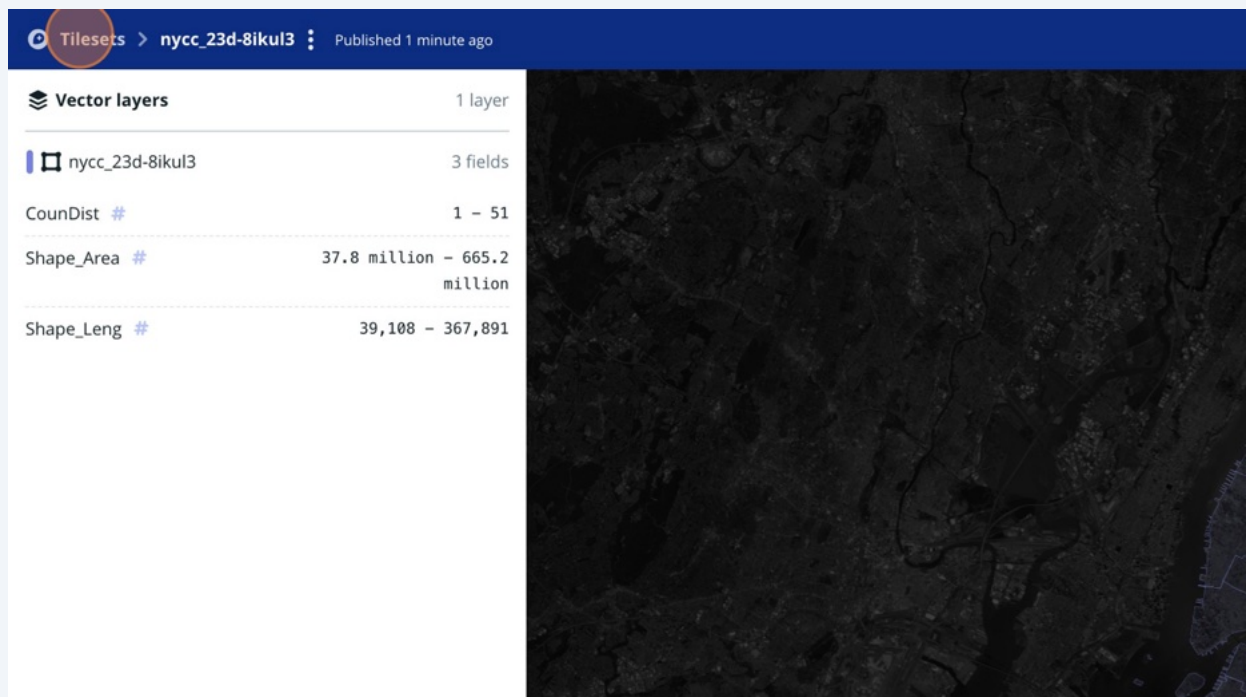

10

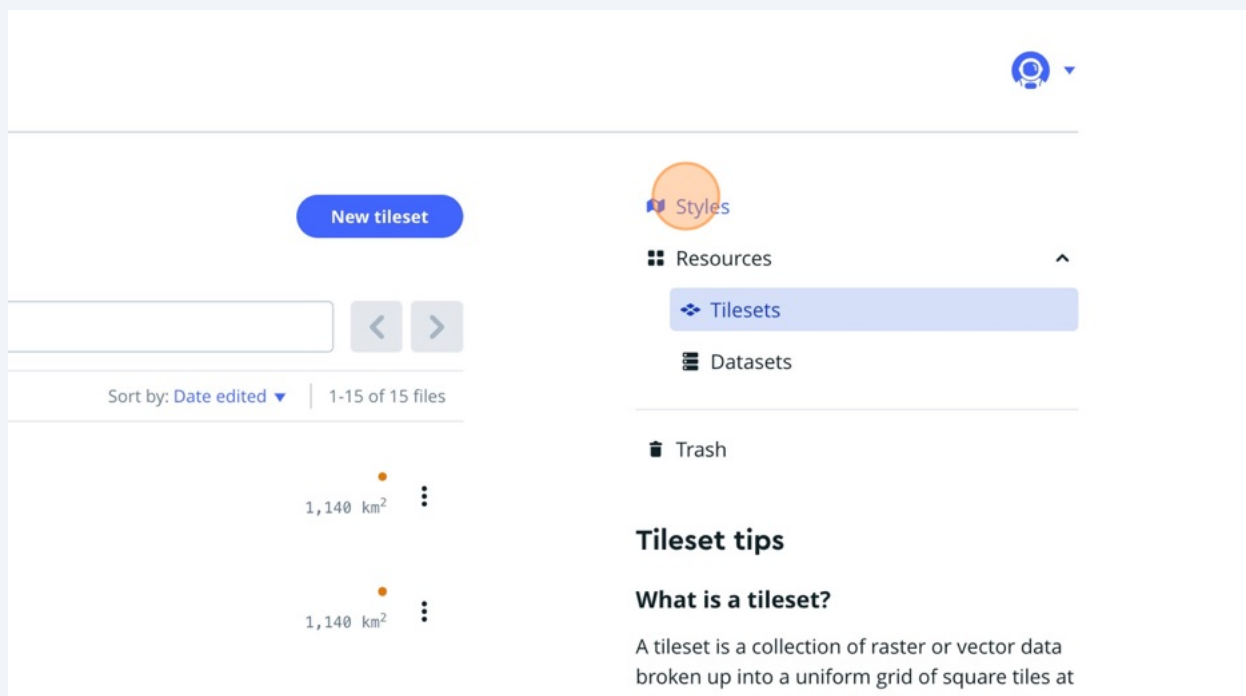

Click the three dots to open the tileset options, and then copy the TILESET ID to your clipboard

11 From here, you'll click Tilesets to go back to the main Studio page

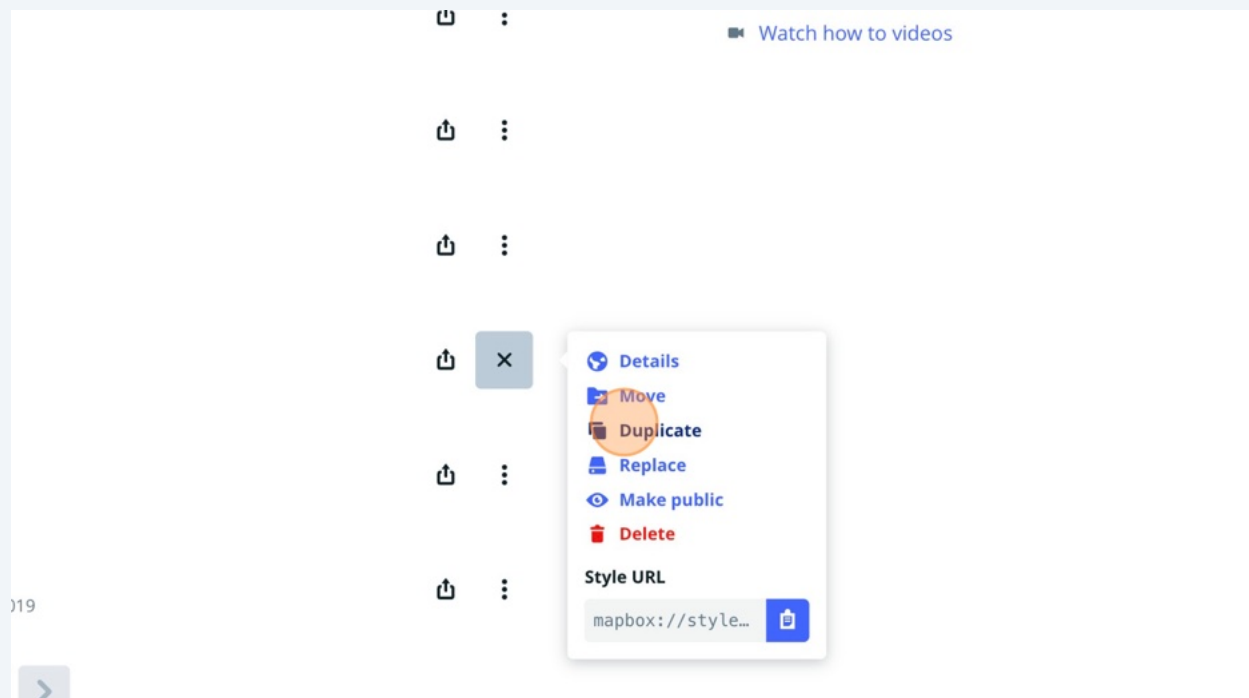

12 Navigate to "Styles"

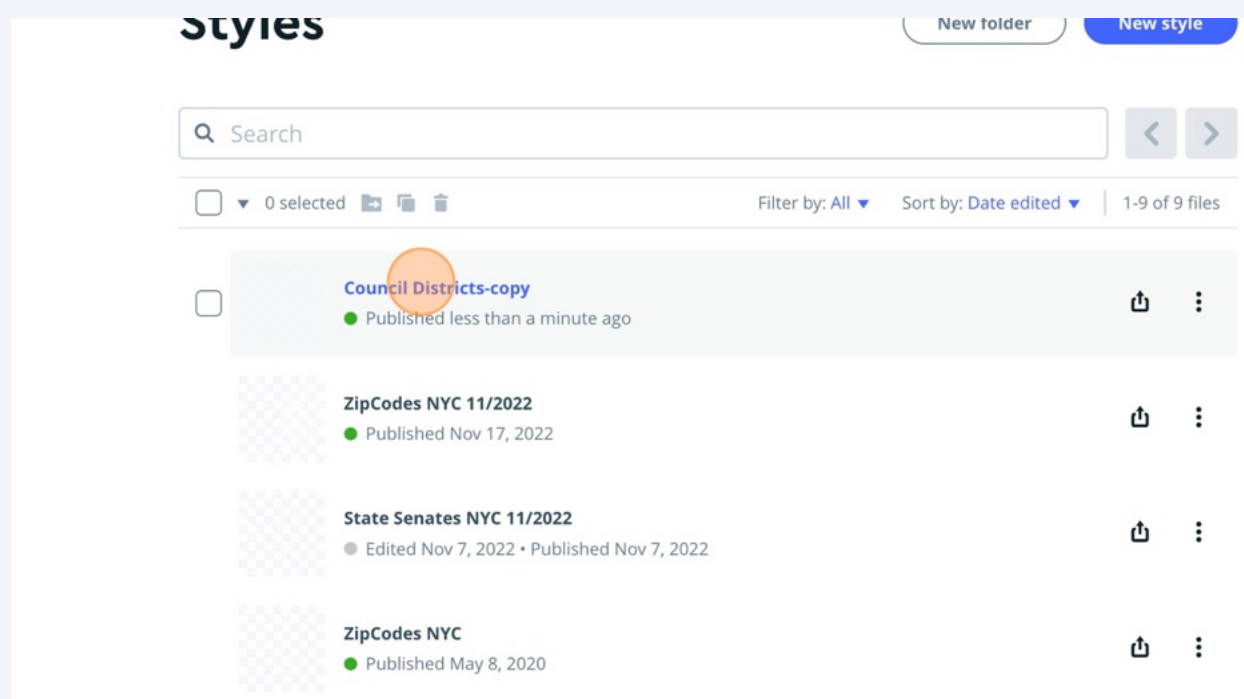

13

Navigate to the prior style used and click "duplicate". We could just edit the style itself - which would automatically update the application's map - but this method let's us keep the view in case we need it.

14

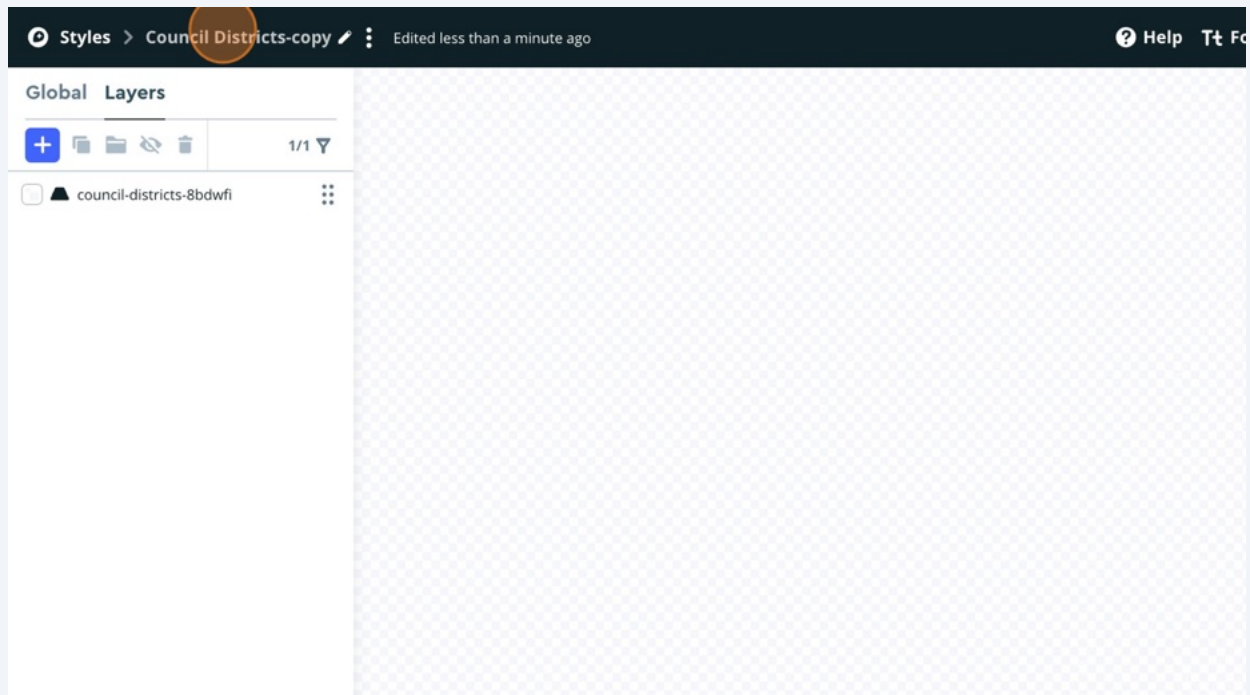

Click the duplicated style to open it (ie. "Council Districts-copy")

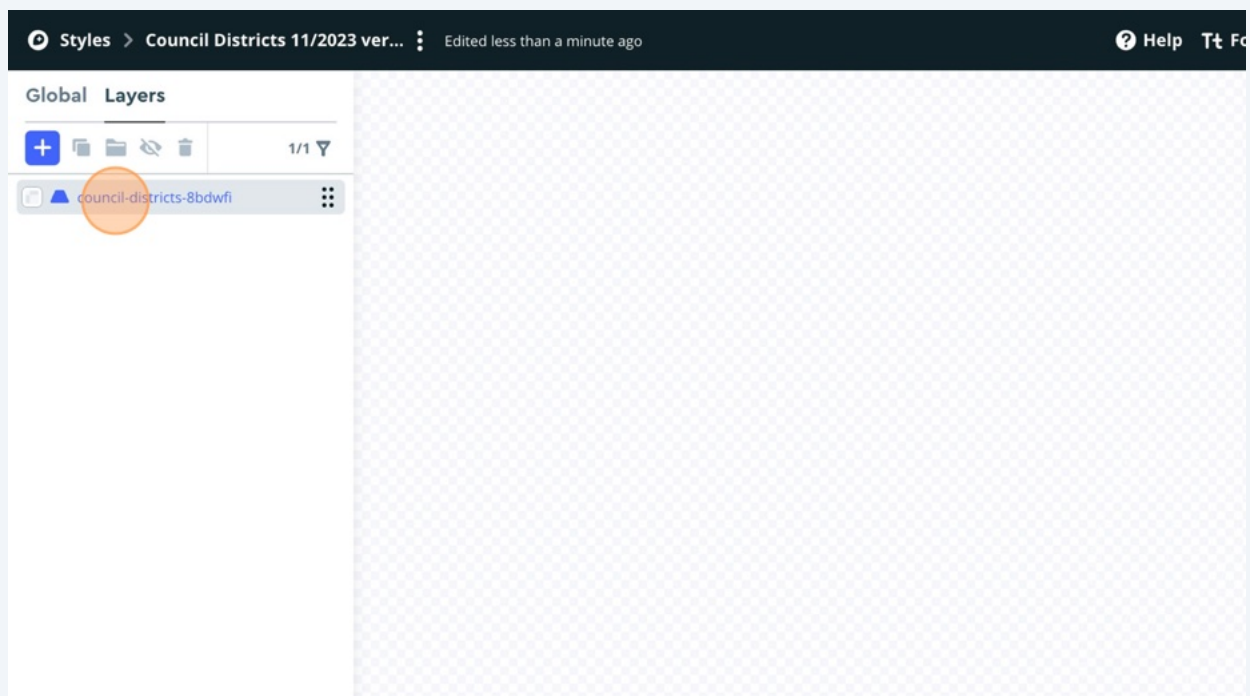

15

Click the style name and rename it (ie. "Council Districts-copy" to "Council Districts 11/22")

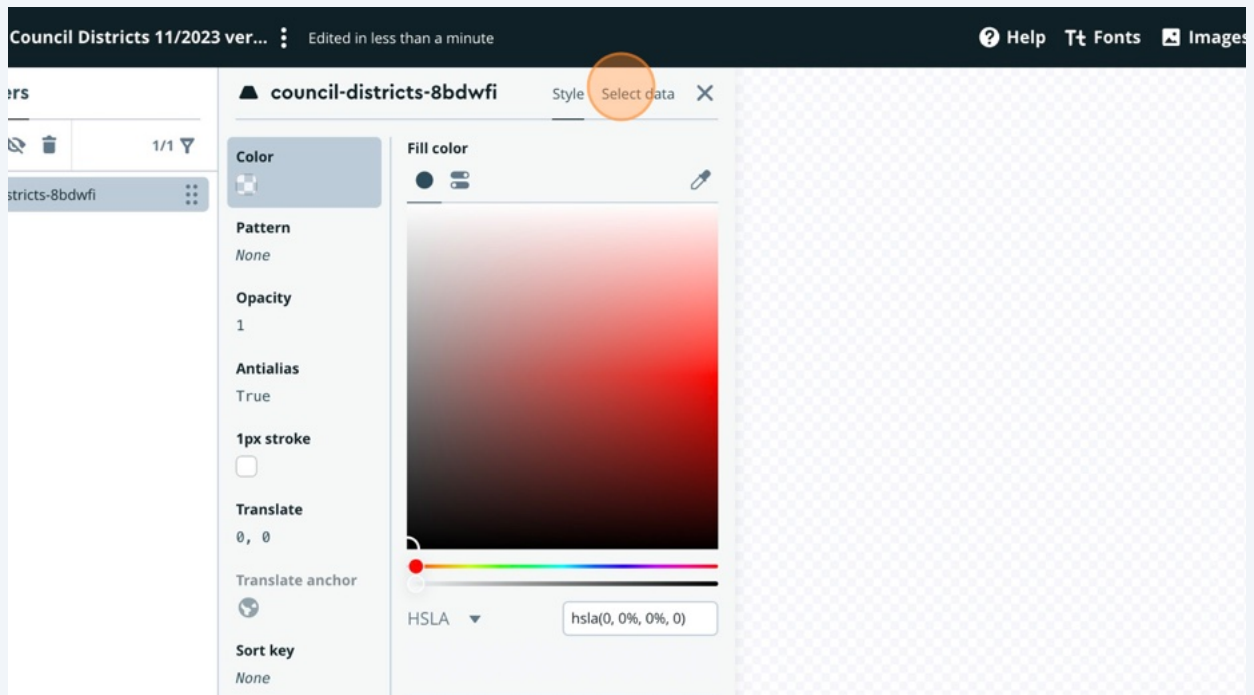

16

Next, click on the active layer

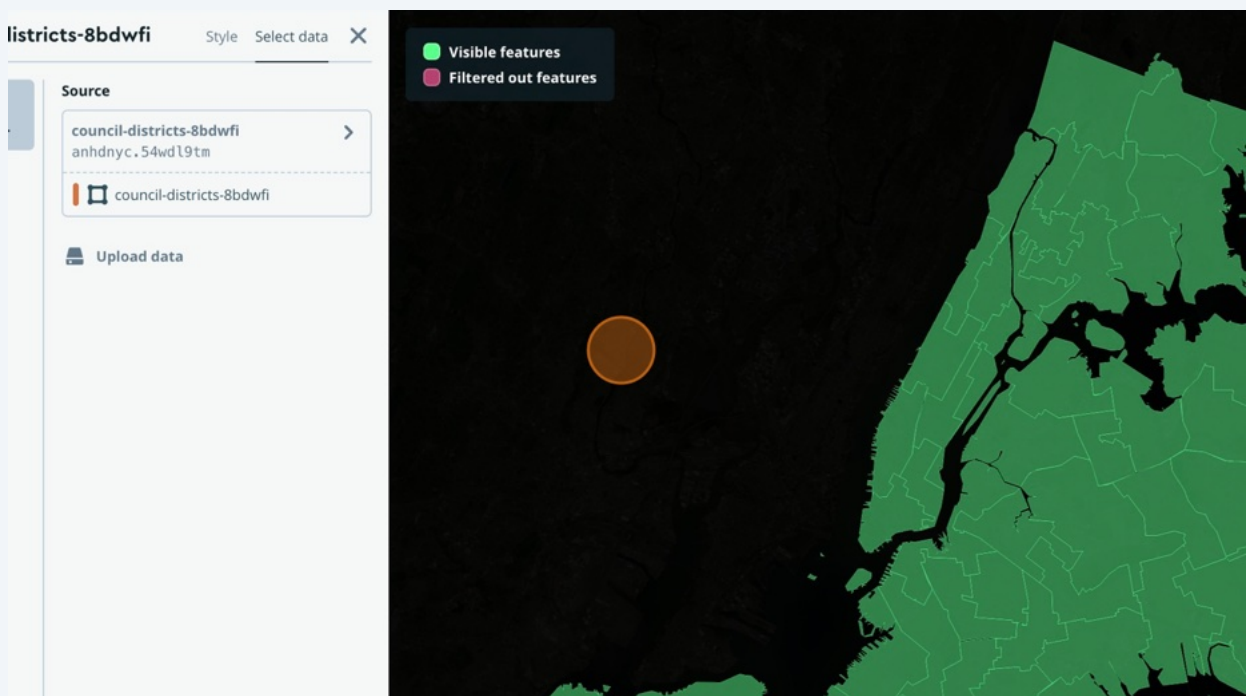

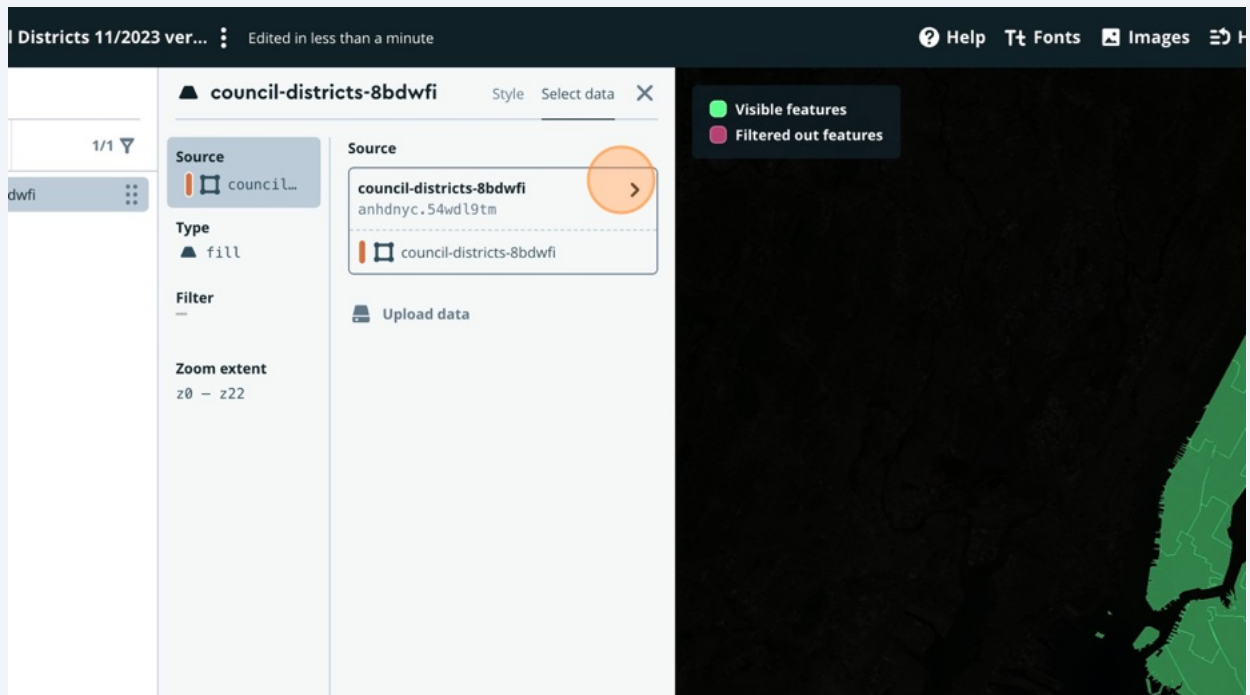

17 and then click "Select data"

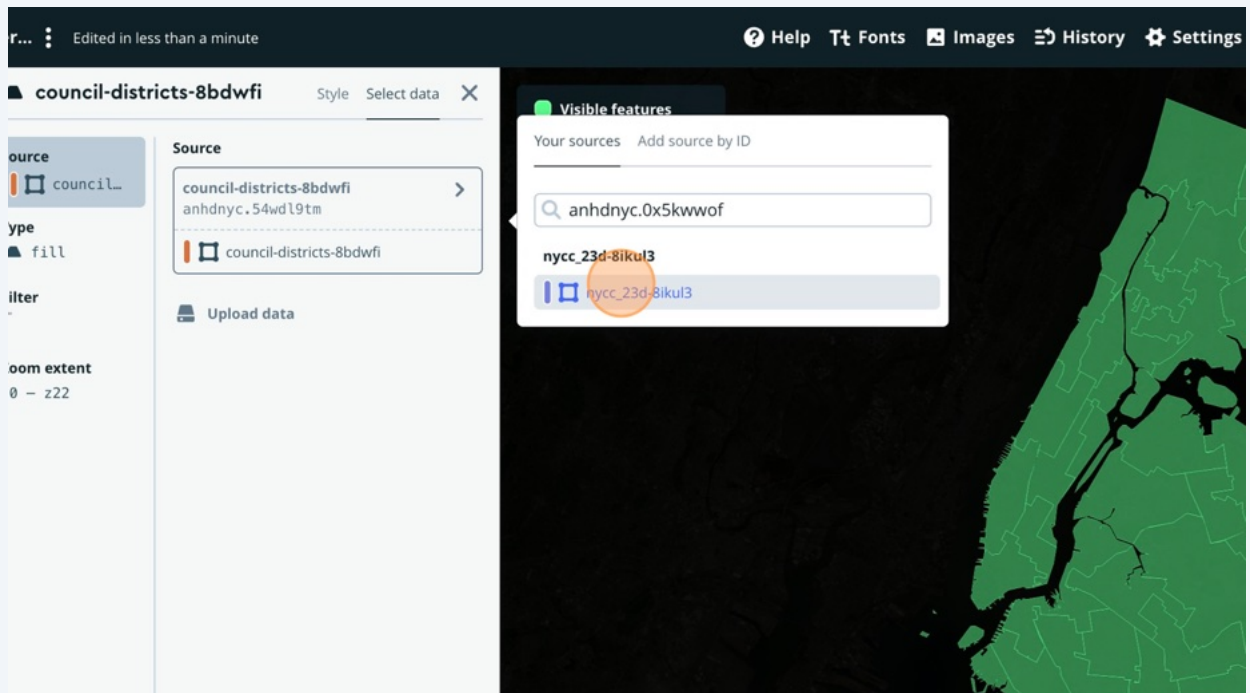

18 The map should now be visible (with the older dataset)

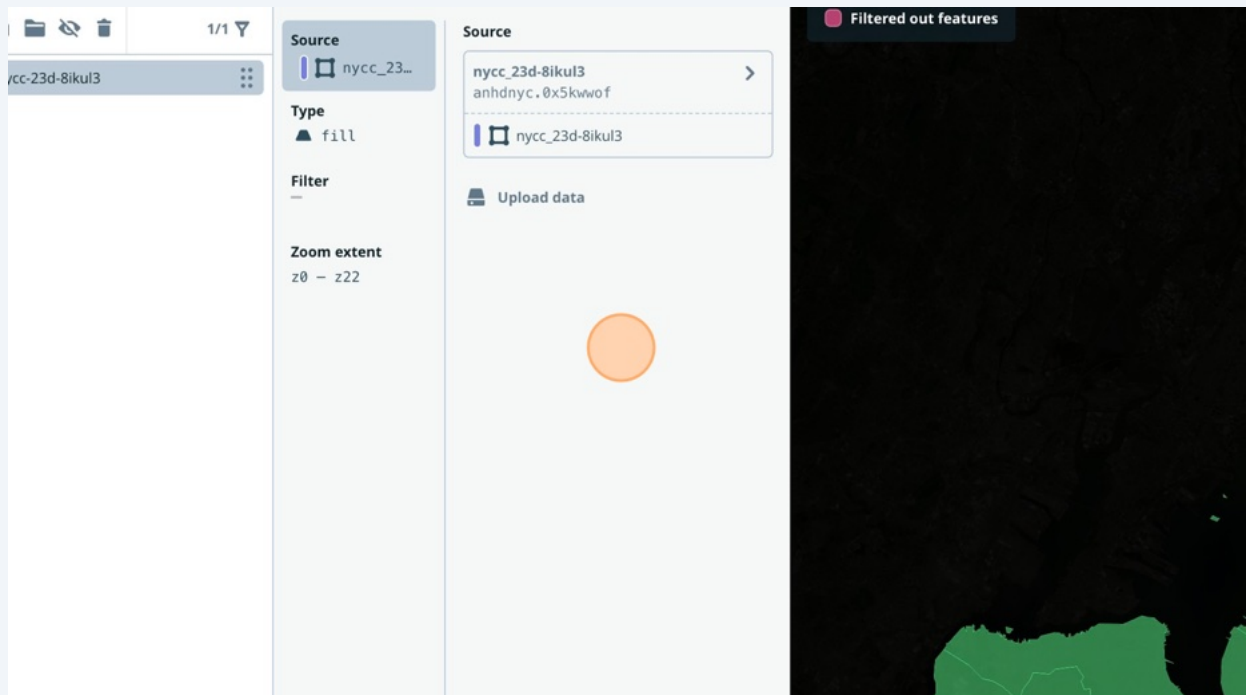

## 19 Click the old source

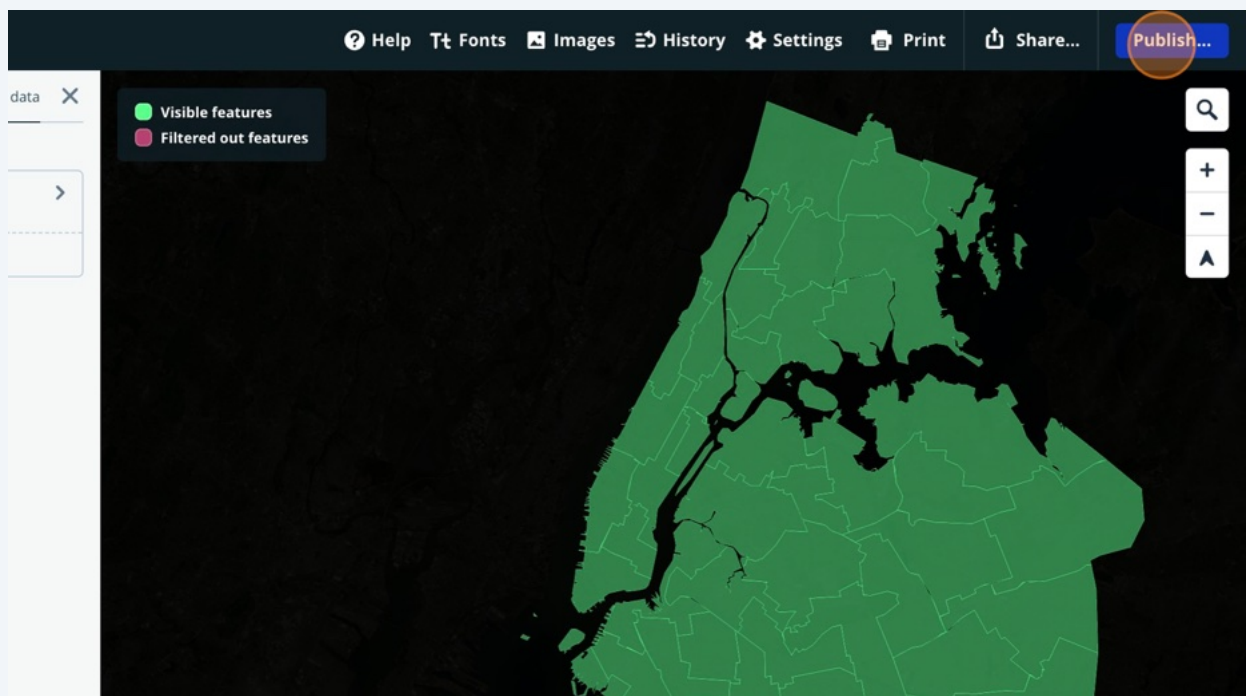

## 20 You can now paste in your tileset ID (which you copied in a prior step) and select it

21 The map should now update with the new tileset / shapes

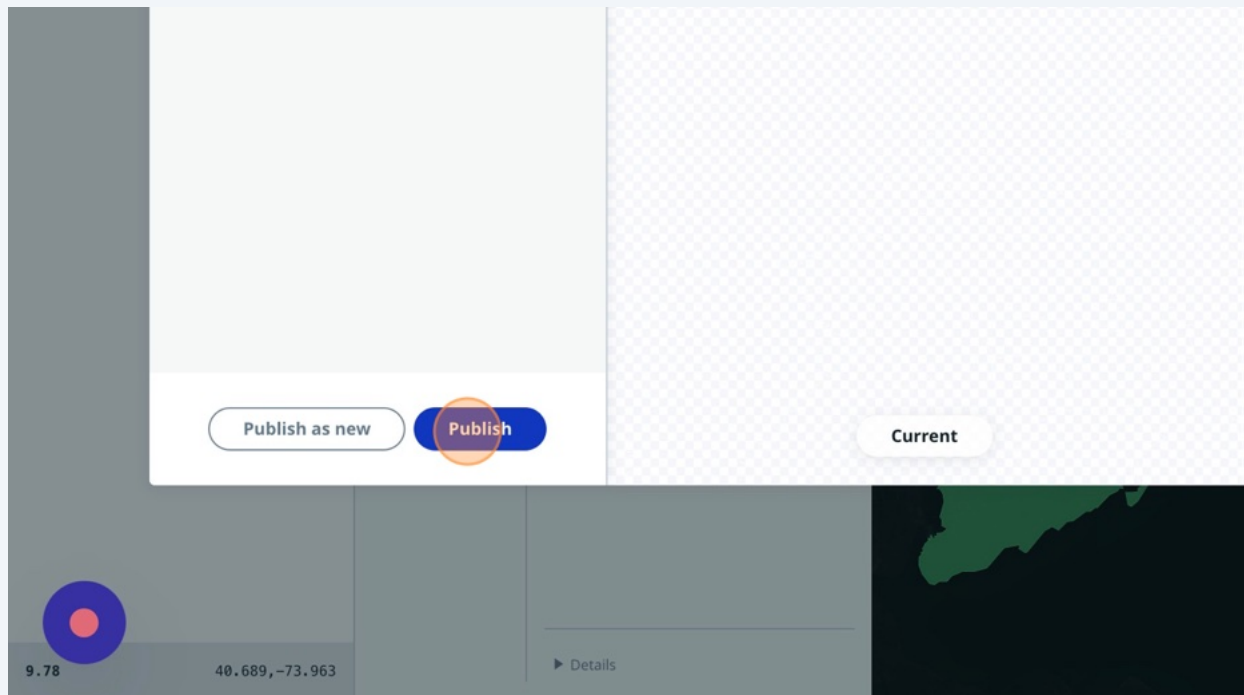

22 Click "Publish..." in the top right

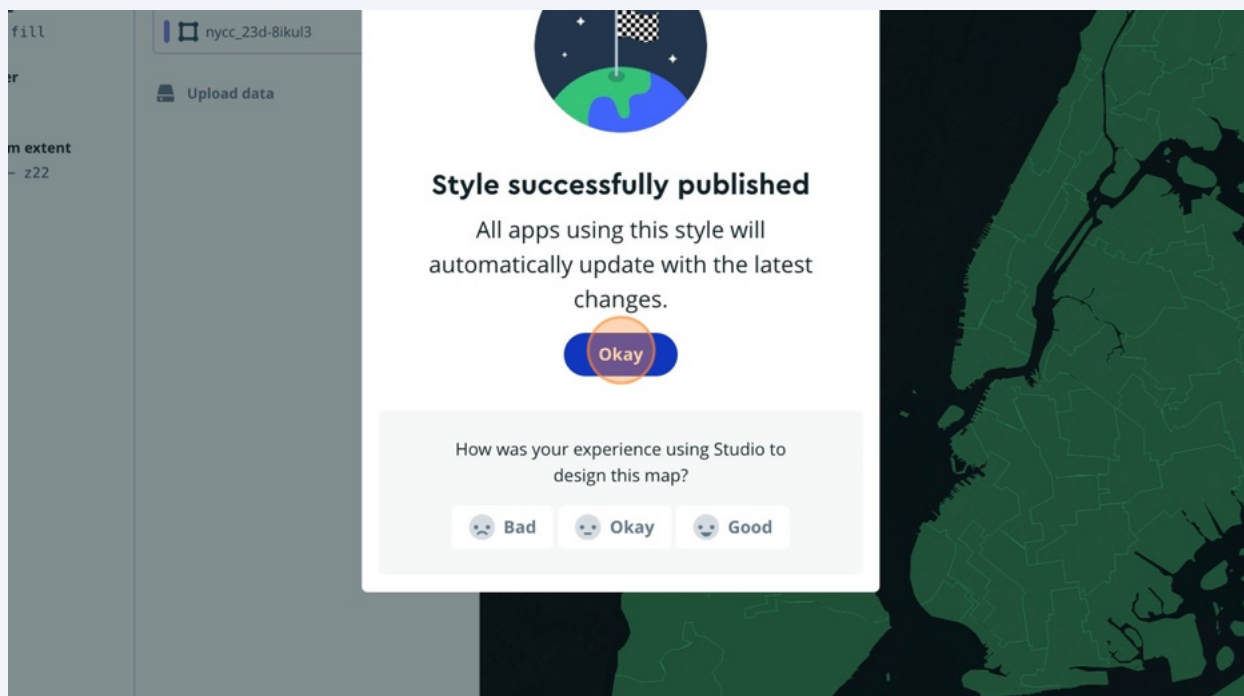

23

Click "Publish" to push it live. As we use the API to access the maps, it can remain "Private"

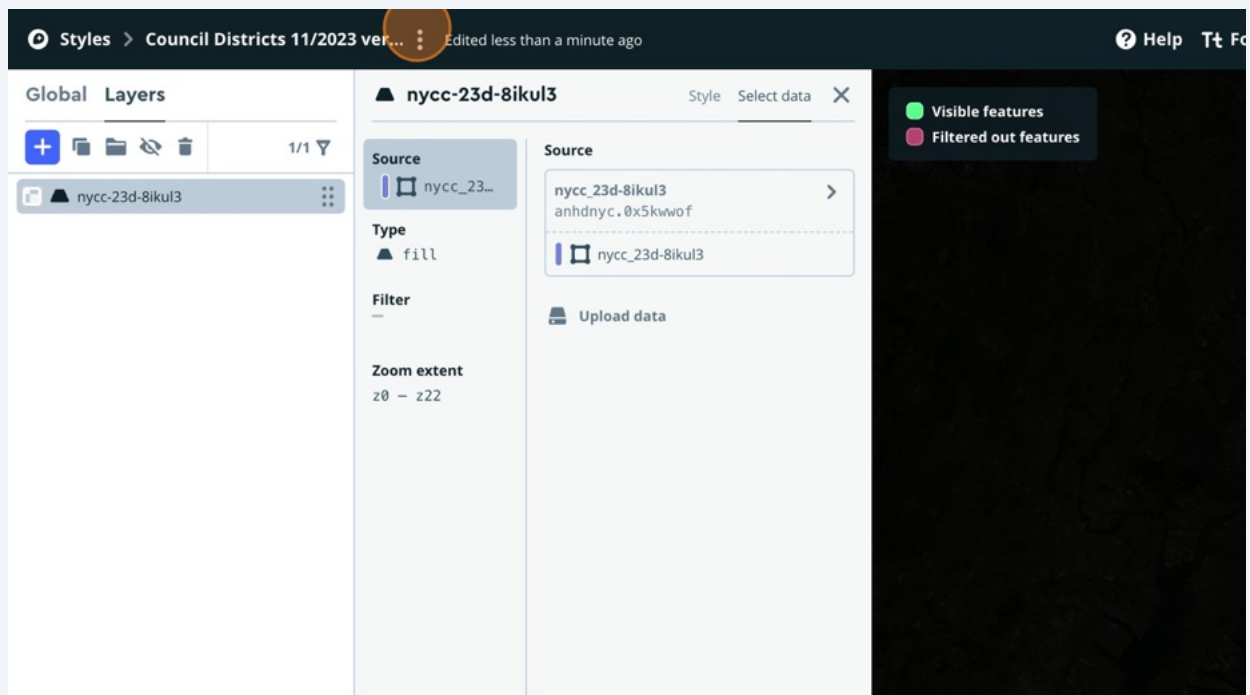

24

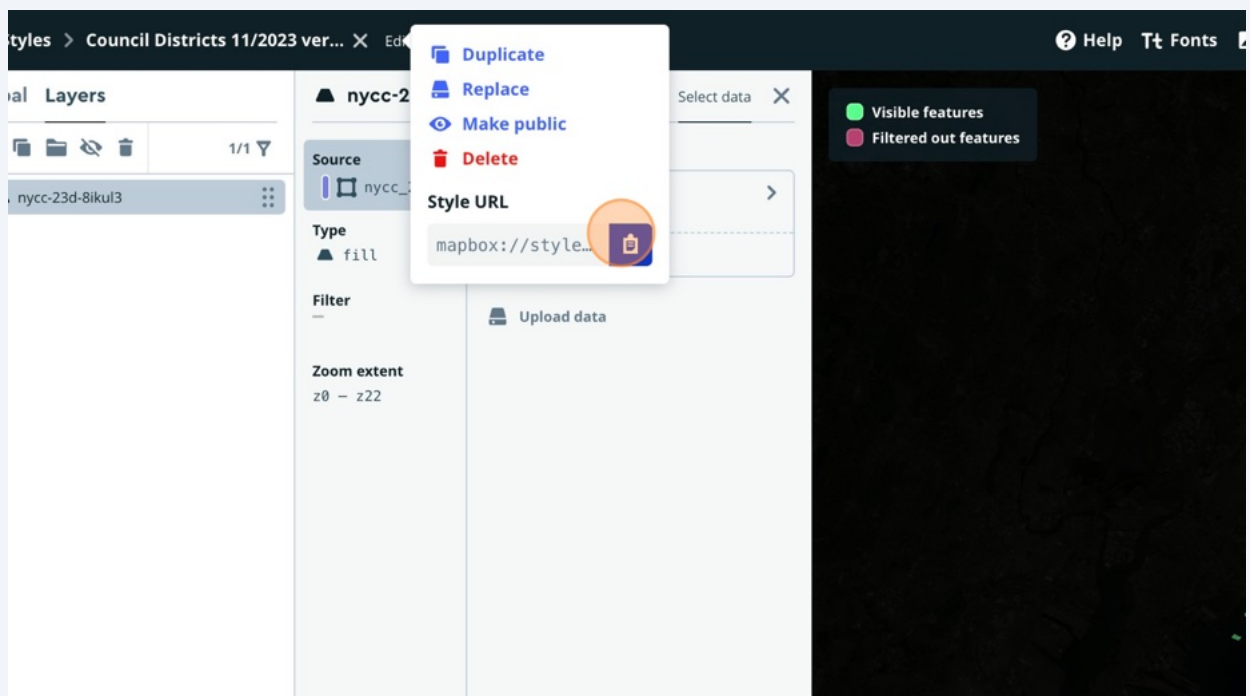

Click "Okay" to dismiss the success box

25 Next, click the three dots / "options"

26 Copy the style URL to your clipboard

27 In your command line, create a new branch on the client frontend and navigate to the index.js for the LeafletMap

28 In the leafletmap index.js, You should see code such as  
`"{this.props.currentGeographyType === 'COUNCIL' && ( <TileLayer  
attribution="mapbox" url="https://api.mapbox.com/styles/v1/anhdnyc/clqze37bt00rl01qrbpju47fw/tiles/256/{z}/{x}/{y}?access token=pk.eyJ1IjoiYW5oZG55YyIsImEiOiIjjanQ0ZWRqaDcxMmRxNDIsbHV1OXN0aGx6In0.i07oerfvXtcRfm3npws7m"/> )}"`

29 Replace JUST the part after /anhdnyc/ in the url with the new route (ie. 'cjtgmvhfl6nw01fs8sqjifqni' ' was replaced by 'clqze37bt00rl01qrbpju47fw' (which was in our clipboard). Please keep everything after this part (ie. /tiles/256, etc)

30 You can now test the branch locally (you may have to hard-refresh your browser or try an incognito window) and then push to production.

NOTE: This will ONLY update the outlines of the districts themselves - and not the properties. After this step, the geojson will need to be uploaded for this dataset to the portal as an UPDATE.

As of this writing, It's also likely the current column with this data may need to be purged, so the app will re-calculate the value for each property. If this specific data isn't purged, the app is coded to only calculate properties that DO NOT already have this data.
